THE IMPACT OF SOCIAL RESPONSIBILITY ON THE COMPETITIVE ADVANTAGE OF SMALL AND MEDIUM-SIZED ENTERPRISES IN HANOI, VIETNAM

Abstract

Small and medium-sized enterprises account for more than 98.2% of total enterprises in Hanoi and contribute significantly to the city's employment, innovation, and GDP. This study aims to analyze and evaluate the influence of corporate social responsibility and green marketing on the competitive advantage of small and medium-sized enterprises in Hanoi, Vietnam. With 292 valid survey responses, data analysis was conducted through PLS-SEM. The study results show that corporate social responsibility and green marketing are critical to the competitiveness of small and medium-sized firms in Hanoi. Corporate social responsibility positively influences green marketing ($\beta = 0.812, p < 0.01$) and corporate reputation ($\beta = 0.458, p < 0.01$). Similarly, green marketing strongly impacts corporate reputation ($\beta = 0.440, p < 0.01$), while corporate reputation contributes substantially to competitive advantage ($\beta = 0.794, p < 0.01$). Indirect effects were also observed. Accordingly, corporate social responsibility and green marketing enhance competitive advantage through corporate reputation, with indirect path coefficients of 0.364 and 0.350, respectively. Additionally, corporate social responsibility indirectly affects corporate reputation via green marketing ($\beta = 0.358, p < 0.01$). The findings show that integrating corporate social responsibility and green marketing strategies improves enterprises' reputation, which in turn improves competitive advantages.

INTRODUCTION

Small and medium-sized enterprises (SMEs) are important in Vietnam's economic development. As the backbone of the city's economy, SMEs in Hanoi contribute significantly to employment, innovation, and GDP. According to the Hanoi Association of Small and Medium Enterprises, as of the first quarter of 2024, small and medium enterprises accounted for more than 98.2% of the total number of enterprises in Hanoi, most operating in the service, manufacturing and retail sectors. Small and medium enterprises create jobs for 55.1% of the workforce, contributing over 40% of the city's GDP (Thuy, 2024). These enterprises are often characterized by their agility, quick adaptation to market changeability, and pivotal role in local supply chains.

In the context of globalization and increasing social awareness of environmental issues, businesses, especially SMEs, are strongly transforming to pursue sustainable development strategies to enhance competitiveness. Studies show that sustainable development strategies for businesses include corporate social responsibility (CSR), green marketing, and corporate reputation. Corporate social responsibility

refers to a company's commitment to ethical practices, community welfare, and environmental protection, a driving force of customers in making decisions (Carroll, 1991). Green marketing has gained attention since businesses increasingly align themselves with the sustainability movement (Ottman, 2011).

Recent studies consider CSR activities and green marketing as essential factors that can improve a company's reputation and competitive advantage because customer expectations are increasingly focused on businesses' socially and environmentally responsible activities. SMEs often operate with limited resources, so the development and application of effective CSR and green marketing are essential for SMEs to differentiate themselves in the market.

1. LITERATURE REVIEW AND HYPOTHESES

The corporate social responsibility (CSR) concept has emerged as a critical aspect of business strategy, especially for small and medium-sized enterprises. CSR can be briefly defined as enterprises' active commitment to social and environmental issues in their operations and stakeholder interactions (Carroll, 1999). Aguinis and Glavas (2012) refined this definition, acknowledging CSR's complexity and multidimensional nature. CSR activities range from philanthropy and ethical labor practices to environmental sustainability and stakeholder engagement (Dahlsrud, 2008). Accordingly, businesses should go beyond their benefit or profit maximization goals in order to consider the broader influences of their activities on society and the environment (Freeman, 1984). For SMEs, effective engagement in CSR can increase customer loyalty, which, in turn, strengthens their market position (Gürlek et al., 2017). SMEs that integrate CSR into their core strategies experience better financial outcomes and a stronger market position because they get more favorably by both consumers and investors (Ha et al., 2022; Li et al., 2023).

This study approached CSR in a comprehensive and balanced manner between economic, societal, stakeholder interests and environmental responsibilities. Firstly, economic CSR dimensions focus on how businesses contribute to economic development while ensuring ethical practices. According to Friedman (1970), the primary responsibility of businesses is to generate profits for their shareholders. However, such a view has been challenged by the increasing recognition that businesses must also contribute to economic stability and growth in a socially responsible manner (Porter & Kramer, 2007). SMEs, in particular, play

a critical role in economic development by fostering innovation, creating jobs, and contributing to local economies (Spence, 2016). Economic CSR for SMEs also involves ensuring fair wages, ethical supply chain practices, and transparency in financial reporting (Jamali et al., 2017).

Secondly, societal CSR dimensions refer to the impact of businesses on society, such as contributions to education, social welfare, and community development. Accordingly, SMEs' participation in societal CSR can include practical activities such as participating in community development projects, supporting local charities, and creating inclusive employment (Jenkins, 2006). Lee (2008) shows that businesses' societal CSR activities can enhance their company's reputation, increase customer loyalty, and contribute to their long-term sustainable development.

Thirdly, the CSR for stakeholder perspective refers to businesses' responsibilities to their stakeholders, including employees, customers, suppliers, and the community (Freeman, 1984). In recent years, stakeholder engagement in CSR has been highlighted, particularly for SMEs, which often have closer relationships with their stakeholders than giant corporations (Spence, 2016). Effective stakeholder engagement can improve business outcomes, such as increased trust, customer satisfaction, and employee retention (Greenwood, 2007). Studies have also shown that SMEs prioritizing stakeholder interests are more likely to achieve sustainable growth (Morsing & Schultz, 2006).

Finally, environmental CSR focuses on the responsibility of businesses to minimize their environmental impact. Such responsibilities include reducing carbon emissions, managing waste, conserving resources, and promoting sustainable

practices (Hart, 1995). In particular, the growing societal awareness of climate change and environmental degradation will promote the consideration of environmental CSR as an essential component of businesses' responsibility (Bansal & Roth, 2000). Despite their smaller scale, SMEs have a significant role in environmental sustainability. Conversely, environmentally responsible practices can enhance SME competitiveness by meeting the rising demand for sustainable products and services (Jenkins, 2009).

Green marketing in the context of SMEs refers to the process of developing and promoting products and services that are environmentally sustainable. Nowadays, SMEs adopt green marketing as a tool to promote sustainable development and improve business performance. Through practical activities such as green product innovation, green packaging, eco-friendly production processes, and changing advertising tactics, SMEs reduce their negative environmental impacts and enhance their reputation as well as competitive advantage (Hussain Shah, 2022). Green marketing practices in SMEs have gained attention because consumers become increasingly conscious of environmental issues, leading to an increasing demand for eco-friendly products and services (Dangelico & Vocellelli, 2017). Combining green marketing strategies with green product innovation has proven effective in optimizing business performance and expanding market share in an increasingly environmentally conscious market (Ma et al., 2018). This study examines the green marketing of SMEs through green product innovation, green packaging, green advertising, and green process innovation.

Green product innovation refers to developing new or modified products with environmental benefits, such as reduced energy consumption, lower emissions, or sustainable materials. SMEs are particularly innovative in this area due to their flexibility and ability to quickly respond to market needs. Studies have demonstrated that GPI can help businesses improve operational efficiency while minimizing environmental impact through using recycled or environmentally friendly materials and optimizing product design to reduce energy consumption and emissions during use (Ma et al., 2018). However, Ma et al. (2018) also pointed

out that businesses must combine product innovation with efficient and creative business models to optimize profits because of challenges in the commercialization of green products, such as changes in consumer habits and raw material costs.

Green packaging refers to reducing the impact of packaging on the environment through using recycled or biodegradable materials and reducing packaging size. Green packaging reduces negative environmental impacts and helps businesses achieve economic benefits through cost reduction and increased competitive advantage (Sarfraz et al., 2022). Adopting green packaging can help businesses enhance their brand image and meet the increasing demand from consumers for environmentally friendly products (Sarfraz et al., 2022). Research in South Africa shows that manufacturing SMEs can gain a competitive advantage through green packaging and green advertising, contributing to improved business performance (Maziriri & Liu, 2020). Adopting green packaging in SMEs reduces waste and creates new opportunities for sustainable development, especially in developing markets. However, to succeed, businesses need to integrate innovation elements in processes and products, along with building appropriate business models (Ma et al., 2018; Sarfraz et al., 2022).

Green advertising is businesses' messages about environmentally friendly products and services, aiming to positively impact customers' consumption behavior (Sarfraz et al., 2022). For SMEs, using green advertising builds customer trust, enhances brand reputation, as well as creates competitive advantages in the market (Ma et al., 2018; Muralidharan & Sheehan, 2018). However, the biggest challenge for SMEs is the need for more resources and technology to develop truly green and trustworthy products or services (Sarfraz et al., 2022).

Green process innovation involves adopting environmentally friendly processes to produce and deliver goods and services, such as reducing energy consumption and waste and minimizing emissions. Businesses' advanced technology and digital leadership applications can help improve their efficiency of production processes and enhance their innovation capabilities and adaptability to

change, thereby improving financial results and helping enterprises develop sustainably (Sarfraz et al., 2022). Ma et al. (2018) also show that applying innovative business models can optimize the economic performance of enterprises, help increase competitive advantage, and improve operational efficiency. In addition, Fernando et al. (2019) identified green processes as a critical driver of sustainability in SMEs.

Corporate reputation is often studied in the context of large corporations. However, the corporate reputation of SMEs has attracted considerable attention recently. Generally, corporate reputation refers to the collective perception of a company's stakeholders, including customers, employees, investors, and the broader community, regarding the firm's ability to deliver value (Deephouse & Carter, 2005). For SMEs, corporate reputation is particularly crucial due to its influences on customer loyalty, employee commitment, and the firm's competitiveness in the marketplace (Walker, 2010). Because of limited resources compared to larger companies regarding marketing budgets or brand recognition, SMEs often rely on reputation as a strategic asset.

According to Porter (1985), competitive advantage comes from businesses performing different or similar activities in a different way than their competitors. In the case of SMEs, the source of competitive advantage mainly comes from flexibility, creativity, and effective resource management. Unlike large enterprises, SMEs often rely on their agility and ability to leverage niche markets as sources of competitive advantage (Kraus et al., 2018). Because SMEs face challenges with limited resources, including capital, technology, and human resources, to maintain competitive advantage, such businesses must focus on developing core competencies while constantly improving and innovating products and services (Barney, 1991). CSR and green marketing can contribute to competitive advantage by enhancing corporate reputation, attracting and retaining customers, and building brand loyalty (Brønn & Vidaver-Cohen, 2008).

Studies have recently shown a positive influence between CSR and green marketing among SMEs. For instance, Rocacorba et al. (2024) researched the correlation between CSR practices and the effectiveness of green marketing strategies in SMEs.

The study results show that SMEs with higher levels of CSR, including corporate governance, social contribution, and environmental protection, also exhibited more robust green marketing efforts. Essentially, SMEs implementing CSR activities tend to adopt green marketing practices as a way to communicate their commitment to sustainability, thereby progressively improving their reputation as well as building customer loyalty (L. C. Leonidou et al., 2013). In turn, green marketing can enhance the credibility of an SME's CSR efforts, providing tangible proof of the company's dedication to environmental sustainability (Dangelico & Vocellelli, 2017). Therefore, this relationship is essential for SMEs because it promotes sustainable business practices and can bring long-term financial benefits (Martinez-Conesa et al., 2017).

Moreover, CSR has become an essential factor in shaping the reputation of SMEs. Previously, studies have shown a positive correlation between CSR activities and the reputation of SMEs. For instance, Perrini et al. (2007) emphasized that SMEs engaging in CSR activities will improve their standing with customers, attract and retain talent, and enhance their internal reputation. In addition, CSR activities can reduce risks associated with social and environmental factors that may otherwise harm the reputation of SMEs (Jenkins, 2006). The direct impact of CSR on corporate reputation is also evident in how SMEs communicate their CSR activities. Transparent communication of CSR initiatives helps SMEs build trust with stakeholders, which is important for a strong corporate reputation (Morsing et al., 2008).

Green marketing is becoming acknowledged as a critical tactic for SMEs looking to improve their brand reputation. Consumer awareness and demand for ecologically friendly goods drive SMEs to implement green marketing practices (Peattie & Crane, 2005). Green marketing may help SMEs distinguish themselves from rivals, match the beliefs of environmentally concerned consumers, and ultimately lead to a favorable corporate image and increased brand loyalty (Cronin et al., 2011). Green marketing practices, such as green product innovation, eco-friendly packaging, green process innovation, and sustainable advertising, help an SME demonstrate its commitment to environmental stewardship. Such commitment is a reputation

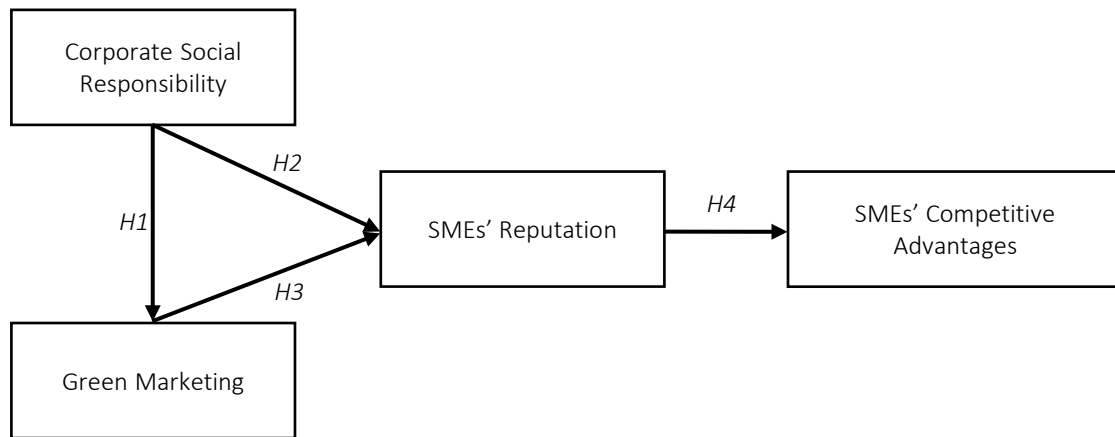

Figure 1. Proposed research model

driver since stakeholders increasingly respect organizations that prioritize sustainability (Ottman et al., 2006). Furthermore, SMEs that successfully include green marketing in their business strategy may dramatically boost their company reputation (C. N. Leonidou et al., 2013).

Furthermore, corporate reputation has been recognized as a critical intangible asset that can significantly enhance an SME's competitive advantage (Fombrun & Shanley, 1990). A strong reputation can act as a differentiator that allows SMEs to compete on quality, reliability, and ethical business practices rather than price (Rindova et al., 2005). In addition, SMEs with a substantial corporate reputation are more likely to attract talented employees, contributing to their competitive advantage by promoting innovation and operational excellence (Carmeli & Tishler, 2004). Empirical studies have shown that SMEs that focus on investing in building and maintaining a positive corporate reputation tend to experience better financial performance and sustained competitive advantages over time (Roberts & Dowling, 2002).

Previous studies have focused on clarifying the role of corporate social responsibility and green marketing in building competitive advantage for SMEs. Accordingly, CSR helps improve customer loyalty and corporate reputation, while green marketing enhances competitive position through product innovation, environmentally friendly packaging, and green processes. However, more empirical evidence in the context of enterprises in Hanoi is needed to better reflect the specific influence in the local business environment.

This study aims to analyze and evaluate the influence of corporate social responsibility and green marketing on the competitive advantage of small and medium-sized enterprises in Hanoi, Vietnam. Figure 1 shows the proposed research model.

Based on the theoretical basis and empirical research results on the impact of factors affecting the competitiveness of SMEs, the following hypotheses are proposed:

- H1: Corporate social responsibility activities positively impact the implementation of green marketing strategies in the context of SMEs in Hanoi.*
- H2: Corporate social responsibility activities positively impact corporate reputation in the context of SMEs in Hanoi.*
- H3: The implementation of green marketing strategies positively impacts corporate reputation in the context of SMEs in Hanoi.*
- H4: Corporate reputation positively impacts competitive advantages in the context of SMEs in Hanoi.*

2. METHODS

With the partial least squares structural equation modeling (PLS-SEM), the Smart PLS (v.4.1.0.0) software is used to test the hypotheses and the suitability of the proposed research model. The coefficients and indicators that need to be measured and

Figure 2. Description of the survey samples

analyzed for the model include the outer loading coefficient (greater than 0.7), assessment of convergence (Cronbach's Alpha and composite reliability (CR) coefficients ≥ 0.7), multicollinearity analysis by collinearity statistics coefficient ($1 < VIF < 3$), and analysis of the relationship and impact of variables using bootstrap, SRMR, R^2 , and f^2 .

The questionnaire consists of two parts. Part 1 includes basic survey questions about survey subjects: age, gender, occupation, and income. Part 2 includes 46 questions to measure the impact of social responsibility and green marketing on the competitive advantage of SMEs in Hanoi. Respondents answer questions on a 5-point Likert scale, from 1 (Strongly disagree) to 5 (Strongly agree). The questions are based on the order of the given model.

Sampling is an essential process for quantitative studies. The sample must be objectively selected and large enough to meet the study's objective (J. Hussey & R. Hussey, 1997). The survey subjects are managers and employees of small and medium-sized enterprises in Hanoi. The sampling frame is a list of respondents classified by age groups (19–25, 26–35, 36–45, and over 46) with many positions from staff, team leader/deputy team leader, department leader/deputy manager, director, or higher. This study uses a convenience sampling technique. Accordingly, sample units are selected based on convenience or accessibility. Hair et al. (1998) propose that the reasonable minimum sample size is five times the number of observed variables. In addition, Tabachnick and Fidell (2014) and Green (1991) suggest the formula $50 + 8 \cdot m$ to calcu-

late the minimum sample size for multivariate regression analysis. In this case, m is the number of independent variables. With 46 observed variables in this study, the minimum sample size needed is ≥ 230 . This study collected 292 valid survey responses, ensuring the reliability of the sample. After identifying the target as managers and employees of SMEs in Hanoi, the questions were arranged according to scientific variables. The questionnaires were sent directly to managers or business employees who were accessible. The online survey links were also sent to the Association of SMEs in Hanoi. Online survey forms were conducted from the beginning of August 2024 to September 2024. The online survey form helped reduce the cost of reaching the audience, the cost of coding, data entry, and the quick survey time.

The survey sample was mainly collected using an online survey using Google Forms. The total number of recall questionnaires is 331, but only 292 are valid and can be used for data analysis. Figure 2 shows the survey sample in terms of age and gender.

Although the survey was designed to accommodate a wide range of respondents, the age distribution shows that most respondents are between 26 and 45. This could influence the results that assess factors related to work experience or workers' views at different stages of their careers. In addition, the gender ratio was relatively balanced, helping to ensure the representation of both men and women in the study. This result may contribute to reflecting the perspectives and experiences of both genders in the study's analyses and conclusions.

3. RESULTS

The results of running the PLS-SEM algorithm are shown in Table 1.

According to Hair Jr et al. (2014), the relationship between the variable's structures will ensure the

convergent value when the composite reliability (CR) coefficient and Cronbach's Alpha coefficient ≥ 0.7 , the average variance extracted coefficient (AVE) ≥ 0.5 . Table 1 shows that all concepts have Cronbach's Alpha and composite reliability (CR) coefficients that are more significant than 0.7, the AVE coefficients are greater than 0.5, and all outer

CAD5		0.865				

loadings are more significant than 0.7. Thus, the concepts have both reliability and convergence values.

The heterotrait-monotrait ratio (HTMT) coefficient measures the discriminant validity between variable constructs. Henseler et al. (2015) suggest two threshold values to evaluate the discriminant validity between indicators' data set of latent variables (*i* and *j*) as follows:

- If $HTMT_{ij} > 0.9$, the indicators' data sets of two latent variables (*i* and *j*) are similar.
- If $HTMT_{ij} \leq 0.85$, the indicators' data sets of two latent variables (*i* and *j*) reach discriminant validity.

Table 2. Discriminant validity

	CAD	CR	CSR	GM
CAD				
CR	0.849			
CSR	0.763	0.861		
GM	0.746	0.848	0.831	

Note: CSR = Corporate Social Responsibility; GM = Green Marketing; CR = Corporate Reputation; CAD = Competitive Advantage.

Table 2 shows that most of the HTMT indexes are less than 0.85. The HTMT index between CSR and CR variables is 0.861, greater than 0.85. However, this HTMT index is close to 0.85 and is still less than 0.9. Therefore, the scales have discriminant validity.

The reliability coefficient results allow the study to take the next step: test the proposed research model. Bootstrapping analysis results (with 5,000 samples and a 5% significance level) evaluate the relationships between the factors. The bootstrapping direct analysis results are shown in Table 3.

Table 3 shows that all *p*-values of the effects are less than 0.01, so these relationships are statistical-

ly significant. The confidence intervals do not include the value 0. All the resulting VIF coefficients are less than 3, so the model has no multicollinearity. Thus, the research results confirm that the proposed research hypotheses are all accepted.

H1 is accepted. Corporate social responsibility activities positively impact the implementation of green marketing strategies in the context of SMEs in Hanoi ($\beta = 0.812, p < 0.01$). This result suggests that businesses concerned with social responsibility are more likely to implement green marketing strategies.

H2 is accepted. Corporate social responsibility activities positively impact corporate reputation in the context of SMEs in Hanoi ($\beta = 0.458, p < 0.01$). This shows that engaging in social responsibility can help SMEs improve their reputation.

H3 is accepted. The implementation of green marketing strategies positively impacts corporate reputation in the context of SMEs in Hanoi ($\beta = 0.440, p < 0.01$). This result suggests that businesses that adopt green marketing strategies will receive high appreciation from the community, contributing to strengthening their reputation.

H4 is accepted. Corporate reputation positively impacts competitive advantages in the context of SMEs in Hanoi ($\beta = 0.794, p < 0.01$). This means that a good reputation can bring a sustainable competitive advantage to businesses, helping them attract customers and maintain growth in the market.

The f^2 coefficient evaluates the degree of small, medium, and significant impact of the exogenous latent variables according to the values of 0.02, 0.15, and 0.35, respectively (Cohen, 1988). Thus, a value of f^2 less than 0.02 proves that the independent variable does not impact the dependent variable.

Table 3. Bootstrapping analysis results of direct effects

Hypothesis	Paths	Original Sample	<i>p</i> values	Confidence Intervals	VIF	f^2	Conclusion
H1	CSR → GM	0.812	0.000	0.772 – 0.853	1.000	1.935	Accepted
H2	CSR → CR	0.458	0.000	0.322 – 0.590	2.935	0.266	Accepted
H3	GM → CR	0.440	0.000	0.310 – 0.571	2.935	0.246	Accepted
H4	CR → CAD	0.794	0.000	0.739 – 0.842	1.000	1.705	Accepted

Note: CSR = Corporate Social Responsibility; GM = Green Marketing; CR = Corporate Reputation; CAD = Competitive Advantage.

Table 4. Bootstrapping analysis results of indirect effects

Paths	Original Sample	p values	Confidence Intervals
CSR → CR → CAD	0.364	0.000	0.250 – 0.475
GM → CR → CAD	0.350	0.000	0.246 – 0.455
CSR → GM → CR → CAD	0.284	0.000	0.201 – 0.372
CSR → GM → CR	0.358	0.000	0.255 – 0.464

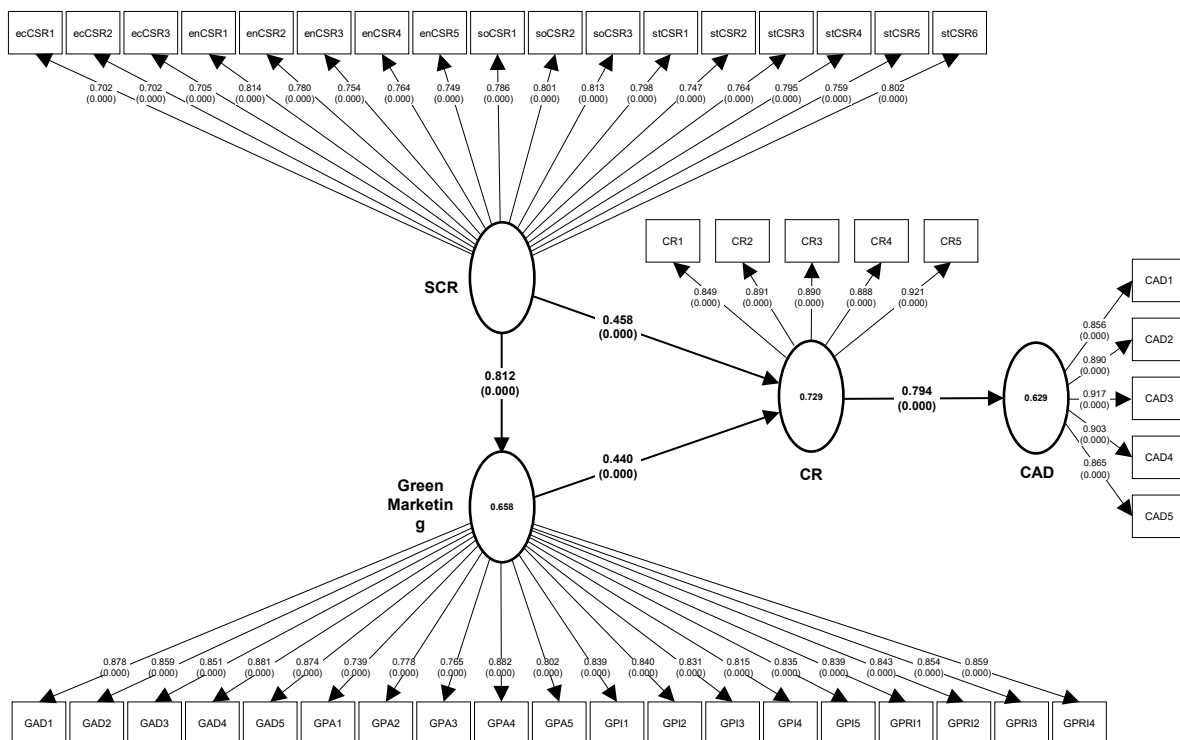

Note: CSR = Corporate Social Responsibility; GM = Green Marketing; CR = Corporate Reputation; CAD = Competitive Advantage.

Table 3 shows that all exogenous variables affect endogenous variables, as shown by the value of the f^2 coefficient, which is more significant than 0.15. Accordingly, CSR and GM variables had a medium impact on the CR variable with the coefficients f^2 of 0.266 and 0.246, respectively. In addition, the CSR variable significantly impacts the GM variable, and the CR variable significantly impacts the CAD variable, with the coefficient f^2 of 1.935 and 1.705, respectively.

Table 4 shows that all p -values of the effects are less than 0.01, and the confidence intervals do not include the value 0. Therefore, these relationships are statistically significant. Accordingly, the CSR and GM variables positively impact CAD through the mediator variable of CR. This result proves that businesses that carry out social responsibility and focus on green marketing can enhance their reputation, thereby increasing their competitive advantage.

Table 4 shows the results of testing the indirect effects of the independent variables on the dependent variables, corporate reputation, and competitive advantages, respectively.

Moreover, the CSR variable is also determined to have a positive indirect impact on the CAD variable through the two mediator variables, GM and CR, respectively. This result shows that mediating

Note: CSR = Corporate Social Responsibility; GM = Green Marketing; CR = Corporate Reputation; CAD = Competitive Advantage; GPI = Green Product Innovation; GP = Green Packaging; GA = Green Advertising; GPR = Green Process Innovation; ecCSR = Corporate Social Responsibility for the Economy; soCSR = Corporate Social Responsibility for the Society; stCSR = Corporate Social Responsibility for the Stakeholders; enCSR = Corporate Social Responsibility for the Environment.

Figure 3. The confirmed research model

variables such as corporate reputation and green marketing play an important role in the relationship between corporate social responsibility and competitive advantage of SMEs in Hanoi.

In addition to the direct impact, the research results also show that the CSR variable indirectly impacts the CR variable through the GM variable. CSR activities directly enhance reputation and indirectly influence it through green marketing activities, suggesting a complex interaction between these variables.

The adjusted R^2 coefficient evaluates the effect of independent variables on dependent variables. Table 5 shows that the adjusted R^2 value of the GM variable is 0.658. Thus, the independent variable CSR explained 65.8% of the variation of the GM variable. The remaining 34.2% was from systematic error and other factors outside the model. Similarly, the independent variables (GM and CSR) explained 72.9% of the variation of the CR variable. Additionally, the independent variable CR explained 62.9% of the variation of the CAD variable. The remaining 37.1% was from systematic error and other factors outside the model.

Table 5. R -square coefficients

Dependent Variables	R -square	R -square adjusted
CAD	0.630	0.629
CR	0.731	0.729
GM	0.669	0.658

Note: GM = Green Marketing; CR = Corporate Reputation; CAD = Competitive Advantage.

Figure 3 depicts the estimated results of the proposed structural model. The path coefficients and p -values are shown on the paths between endogenous and exogenous variables. The outer loadings and p -values are the coefficients on the path between the observed and latent variables. The numbers in the endogenous variables are the R -square adjusted coefficients.

The multi-group analysis (MGA) in SmartPLS evaluates the differences in the impact relationships in the SEM model between different values of the qualitative variable. This study also examines the differences between the male and female survey data on the relationships in the proposed research model.

Table 6. PLS-MGA and bootstrapping results

Paths	PLS-MGA	Bootstrapping Results	
	p values new (Female vs Male)	p values (Female)	p values (Male)
CR → CAD	0.824	0.000	0.000
CSR → CR	0.449	0.000	0.000
CSR → GM	0.412	0.000	0.000
GM → CR	0.588	0.000	0.000

Note: CSR = Corporate Social Responsibility; GM = Green Marketing; CR = Corporate Reputation; CAD = Competitive Advantage.

Table 6 shows that all p -values (in both male and female sample data) in the bootstrapping results are less than 0.05, proving that the impact relationships in the model are statistically significant for both gender groups. This result confirms that the variables in the model significantly affect each other regardless of the gender of the survey participants. In addition, the p -values in the PLS-MGA analysis are greater than 0.05 for all relationships, proving no significant difference between males and females in the impact of the variables in the model. This result shows that the impact relationships between corporate social responsibility, green marketing, corporate reputation, and competitive advantage are stable across genders, suggesting that these factors affect both males and females similarly.

4. DISCUSSION

The results demonstrate a positive effect of corporate social responsibility (CSR) on green marketing among SMEs in Hanoi, Vietnam. The results suggest that CSR activities encourage SMEs to adopt green marketing strategies as part of their commitment to ethical and sustainable practices. In addition, CSR activities also directly benefit SMEs' reputations, indicating that socially responsible behavior improves stakeholder views, trust, and brand equity. SMEs must build and sustain a robust reputation through CSR because this intangible asset provides a competitive edge, especially in resource-constrained environments.

The study reveals that SMEs' implementation of green marketing strategies, which promote environmentally friendly goods, resonate well with consumers and other stakeholders, further enhancing their reputation. Because of the increas-

ing consumer awareness of environmental issues, SMEs adopting green marketing strategies are more likely to build strong, positive reputations in their communities. These findings are consistent with previous research highlighting the positive relationship between CSR, green marketing, and corporate reputation in enhancing competitive advantage, such as Martinez-Conesa et al. (2017), Papadas et al. (2017), and Rocacorba et al. (2024).

These results also show that corporate reputation plays an essential role in the competitive advantage of SMEs in Hanoi. Accordingly, a more robust company reputation gives SMEs a better competitive advantage that helps SMEs to stand out in the market. This means that when SMEs invest in CSR and green marketing, their reputation is boosted, which in turn leads to better performance in the market.

On top of the direct effects, this study also uncovers the indirect influence of CSR and green marketing on the competitive advantages of SMEs in Hanoi through corporate reputation. Corporate reputation's mediating role in linking CSR and green marketing to competitive advantage reveals the layered benefits of these strategies. Accordingly, CSR indirectly enhances competitive advantage by fostering a positive corporate reputation, while

green marketing strengthens reputation, which, in turn, leads to improved competitive positioning. In addition, the study highlights that CSR indirectly affects corporate reputation through its influence on green marketing. Thus, green marketing acts as a bridge between CSR activities and gains in reputation.

The similarities in how men and women evaluate factors such as social responsibility, green marketing, and corporate reputation for competitive advantage may stem from the fact that the values and benefits associated with CSR, green marketing, and corporate reputation have become popular and widely accepted, regardless of gender. The results indicate that in the context of SMEs in Hanoi, CSR and green marketing strategies have equal impacts across gender groups. Accordingly, businesses can apply sustainable development strategies without worrying about gender differences in the effectiveness of those strategies.

Thus, the research results show that leveraging CSR and green marketing for environmental and social benefits is a key factor in the competitive strategy of SMEs in Hanoi, Vietnam. These research results outline a practical roadmap for SMEs to achieve sustainable growth in a rapidly evolving market.

CONCLUSION

This study aims to analyze and evaluate the influence of corporate social responsibility and green marketing on the competitive advantage of small and medium-sized enterprises in Hanoi, Vietnam. The results indicate that corporate social responsibility directly and indirectly affects corporate reputation through green marketing activities. Participation in corporate social responsibility and green marketing activities helps SMEs improve their reputation, enhancing their market competitive advantage. In addition, there is no gender difference in the evaluation of corporate social responsibility, green marketing, and corporate reputation factors. This result suggests businesses apply these strategies widely to men and women without special adjustments for each group.

This study's findings suggest several practical implications for SMEs in Hanoi. First, SMEs in Hanoi should integrate CSR into their business strategies to effectively promote green marketing adoption and enhance their image, which is essential for long-term competitive success. Second, they should not consider green marketing only as an environmentally friendly move but as a way to build a strong brand that contributes to competitive advantage. In short, SMEs in Hanoi should build their reputation through sustainable business practices as a basis for the goal of consolidating their sustainable market position.

Despite the important findings, this study has some limitations. First, it only focused on SMEs in Hanoi, so the results cannot be generalized to businesses in other areas. Second, it collected survey data over

a short period, so it cannot assess the long-term impact of CSR and green marketing on competitive advantage. Finally, it relied mainly on self-reported data from businesses, which may lead to bias due to participant subjectivity.

In future studies, expanding the sample to other regions or the entire country would help improve the representativeness and generalizability of the results. In addition, research can be conducted longitudinally, following businesses over a longer period to assess the sustainable impact of CSR and green marketing on competitive advantage. Other factors such as business size, industry, or cultural differences should also be considered to assess further the different aspects that influence the relationship between CSR, green marketing, reputation, and competitive advantage of businesses.
