Business characteristics of small and medium enterprises in rural areas: a case study on southern region of KwaZulu-Natal province of South Africa

Abstract

This paper reports on the small and medium enterprises (SMEs) business characteristics in rural places of Southern KwaZulu-Natal (KZN) province. It was intended to identify and discuss the various characteristics and the implications they have on the survival and growth of rural enterprises. The study was conducted in five areas (uMuziwabantu, Ubuhlebezwe, Sisonke, Zingolweni and uMzimkhulu) Southern Region of KZN province. The sample consisted of 127 SMEs owners/managers operating in the selected areas using a quota sampling method, with respondents completing a five-point Likert scale questionnaire with the assistance of an interviewer. The findings indicated that most employees within the business are unskilled; the business operations are run by using modern facilities; most of business investment strategies are hindered by a lack of finance; and the local market is very small in selling rural SMEs’ products. SPSS (23.0) version was used for data analysis. The findings presented in the figures and tables. Statistical analysis revealed that business characteristics of SMEs in rural were tested and found to be significant (P = .000*).

The paper will be useful tool for the policy-makers, business financial support institutions, and business stakeholders, government policy agencies in underlining a new way to consider future growth of SMEs in rural places, to understand challenges properly and to adjust growth strategies for the remote and under-developed areas. Most work has been focusing on SMEs in the urban and metropolitans areas with less emphasis on the rural SMEs with specific reference to KZN. The findings are limited by the quantitative nature, small sample and exploratory study. Therefore, generalization of these results should be done with care and more research with larger samples extended to other provinces is highly recommended.

Keywords: characteristics, rural, small and medium enterprises, Southern KwaZulu-Natal province, business, places.

Introduction

Liu and Pang (2015) show that firm survival tends to increase with firm size, and firm growth tends to decrease with firm age, but increase with firm size. However, according to Gupta, Guha and Krishnaswami (2013), four theoretical perspectives, namely, the resource-based perspective, the motivation perspective, the strategic adaptation perspective and the configuration perspective can be identified as enterprise growth. Mugobo and Ukpere (2011) identify issues, such as small market, limited success to finance, shortage and high cost of raw materials, lack of technical and business skills, as well as inaccessible and unreliable communication and transport services, as the most severe constraints characterizing South African rural SMEs. Harvie, Narjoko and Oum (2010) indicate that entrepreneurial attitudes are those important characteristics needed by SMEs to upgrade their positions in production networks. Chittithaworn, Islam, Keawchana and Yusuf (2011) stress that, in other countries, including Thailand, resources and finance, customer and market, as well as the external environment have been recognized as the main characteristics of SMEs that are the most influential factors in business success of SMEs. In India, it has been noticed that the age of the entrepreneur, educational level, family background and management style contribute to SME operations and are seen as determinants correlating to the growth of the SME industry (Chachar, De Vita, Parveen and Chachar, 2013). Zarook, Rahman and Khanam (2013) maintain that demographic factors, such as age and size, have a positive, significant impact on SMEs accessing of finance.

1. Literature review

1.1. Rural entrepreneurial resources. Harrison and Gibson (2006) show that the inability of small business owners to match their products or services with the demands of the external environment is a major challenge for their strategic growth. SME owners/managers’ level of formal education, access to and use of new technologies and weak management skills also limit the SMEs’ survival and growth (Mensah, 2004). Lyons (2002) supports the idea further that SMEs’ owners/managers themselves are lacking the necessary skills and capabilities required for business start-up and operations. The Sustainable Agriculture and Rural Development (SARD) policy (2007) draws attention to rural enterprises being characterized by many difficult factors, such as limited resources and because of their small size, scattered nature and remoteness, the transaction costs of rural activities are high, mostly the result of the time required to ensure that standards are met. Rural enterprises face business risks that range from managing the power imbalance they find themselves
in versus larger firms, to buyers that can influence terms, conditions and standard requirements. In addition, rural enterprises have limited access to timely market information, mainly due to the country’s weak transport and communications infrastructure, specifically in rural KZN, SARD policy (2007) states that it is very difficult for rural enterprises to participate in a high value market. Hashi (2001), Peci, Kutllovci, Tmava and Shala (2012), Ghisett, Mazzant, Mancinelli and Zoli (2015) point out that the growth of SMEs has been hampered by a variety of barriers, erected directly or indirectly by the state of the environment. Due to fiscal policy constraints, more specifically, high tax rates, financial constraints in the institutional environment are major barriers for SMEs, which have a huge influence in encouraging many SMEs to conduct their activities in the informal sector of the economy. Beck and Demirque–Kunt (2005) explain that many SMEs are survivalists who need continuation of existence and growth beyond their start–up phase. However, the authors believe that this sector is often faced with difficult challenges, such as market deficiencies and institutional faintness, which hinder their growth. Booyens (2011) offers policy recommendations, stating that the government should encourage the growth of “knowledge networks” that will offer SMEs the opportunity to more easily exchange information with domestic and (especially) large international firms.

1.2. Management skills. A number of common factors within the category of business management are considered to play a role in determining the growth of the small business. These include financial management skills and marketing management skills (Dobbs and Hamilton, 2007; Nkosi, 2013; Kusi, Opata and Narh, 2015). Management skills of small business growth concentrate on the identification of the owner-manager’s policies and strategies for the operation and development of their business and the subsequent translation of such policies into managerial action (McMahon, 1998). Penrose (1959) proposes that the growth of the enterprise is limited by the scope of managerial resources, specifically, the ability to coordinate capabilities and introduce new people into the enterprise. Literature reveals considerable doubts regarding the quality of strategic planning and management in this very crucial economic development sector, with policy-makers suggesting particular weaknesses exist in: innovation; a lack of financial acumen; marketing; entrepreneurial flair; practical planning; and management knowledge; as well as human resource management. As a result, many firms do not reach their full potential and fail to grow (Gatukui and Katuse, 2014; Cant and Wiid, 2013). According to Malick and Krishnan (2014), rural markets offer a great scope for a concentrated marketing effort because of the recent increase in rural incomes and the likelihood that such incomes will increase faster because of better production and higher prices for agricultural commodities. Rural marketing is a developing concept, and, as a part of any economy, has untapped potential; marketers have recently realized the opportunity. Improvement in infrastructure and promises rich bright future for those intending to go rural (Ahmed, 2013; Farooqi and Fatma, 2015).

1.3. Technical skills. Entrepreneurial skills assist SMEs to generate growth and development of new ventures in developing economies, such as Kenya, Malaysia, South Africa and Nigeria (Mohammed and Obelagù–Nzélibe, 2014; Situma, Musambayi, Omboto and Yegon, 2015). Robert-Edomi (2013) reports that a recent study conducted in the UK reveals that more than a third (36 per cent) of the UK’s smaller companies admit to a shortage of skilled staff hinder ing their growth prospects. Results of the study show that the biggest gap in the small business skillset is in sales, reported by one in six (16 per cent) respondents. A lack of IT (12 per cent) and financial management (ten percent) expertise came in at second and third places, respectively.

1.4. Education and training development. The key word circling around development of economy in many countries is entrepreneurial education (Kalyani and Kumar, 2011). Entrepreneurship education and training has been found to be a major determinant in the growth and survival of enterprises. According to the human capital theory, investment in knowledge, skills and the abilities enhance the productive capacity of the individual (Njoroge and Gathungu, 2013). However, rural small business owners face challenges that are not generally present in urban locations. As a result, they need training programs that are specific to this context (Siemens, 2012). Entrepreneurship education and training entails a philosophy of self-reliance, such as creating a new cultural and productive environment, and promoting new sets of attitudes and culture for the attainment of future challenges (Arogundade, 2011). Economists have maintained that the major obstacle to economic growth of poor nations is the lack of educated entrepreneurs who are able to mobilize and coordinate production inputs (Bawuah, Buame and Hinson, 2006). The inference here is that financial institutions, able to lend funds to uneducated entrepreneurs who lack managerial expertise, are losing their money away. It is not the financial capital that is lacking, but rather knowledge, ability, and entrepreneurship skills that people possess. In SA, research clearly shows that various problems in schools hinder the effective implementation of entrepreneurship education, some of which are poorly trained
educators and a lack of adequate resources (Isaacs, Visser, Friedrich and Brijlal, 2007). The authors believe that better entrepreneurship education could make a significant contribution to job creation and, ultimately, to poverty alleviation.

1.5. Infrastructure developments. Aleke, Ojilako and Wainwright (2011) argue that productivity and effectiveness of SMEs in developing countries are affected by the diffusion rate of technology. They believe that availability of state-of-art technology is an important driver for business expansion in rural areas. Mazzarol (2015) stresses that technology should be regarded as an essential part of the business owner-manager’s tool box and should not be ignored. He maintains that technology enables small firms to reach millions of people, connect with global supply chains, cost-effectively track customers and enhance internal operations. According to Mbuyisa and Leonard (2015), in South Africa, information and communication technology (ICT) can be used as a tool for driving socio-economic development such as poverty reduction, as well as in the SME environment to enable growth.

Poor infrastructural facilities such as roads and technology have been mentioned to be major obstacles for SMEs’ development and growth (Egbide, Samuel and Samuel, 2013). The South African Rural Development Plan (2013) highlights the need for infrastructure development (e.g., social, economic, information communication technology (ICT), and other enabling infrastructure), enterprise development, small, medium and micro industries (agric-processing, village markets, and finance/credit facilities). These infrastructure developments include high and ever-increasing expansions placed on ICT, in terms of bringing about improvement in quality of life, empowerment and economic development for rural communities (Hosman and Fife, 2008). However, Aruwa (2013) points out that it is not economically viable for SMEs to incur infrastructural costs due to the fact that the SMEs are often located away from commercial centres, with a direct negative impact from any infrastructure shortcomings. Consequently, Aruwa argues that inadequacy of infrastructural components, such as electric power supply, transportation, industrial estates and telecommunications, are the major barriers to an effective SMEs’ take-off.

2. Research methodology

Primary data were collected from small and medium business owners/managers operation in rural areas of the Southern region of KwaZulu-Natal province. Survey questionnaires were distributed to 127 respondents from the selected areas (uMuziwabantu, Ubulhebezwne, Sisonke, Zingolweni and uMzimkhulu). Previous literature review was used as the source of information from which to formulate the questionnaire, which was consisted only closed-end. The study used non-probability sampling method, in the form of quota sampling, was used to obtain the desired sample. Quota sampling was used due to time, financial constraints and unavailability of proper list of registered business in the selected areas of survey. The final usable sample is shown in Table 1 in terms of quota control characteristics. A quantitative technique was used to collect primary data. In order to standardize the conditions under which the questionnaires were completed, research assistants from local villages in the selected areas were recruited and trained as fieldworkers. Questionnaires were personally delivered to the target population. The respondents’ ability to answer the questionnaire was increased by the provision of a number of instructions throughout the questionnaire, which was personally administered. Data analysis was done by using SPSS (23.0) version and it was reliable at .839 in the Cronbach’s Alpha test. The sample quotas were based on three categories of area of the business, number of years of business in operation and how business owned. The profile of the final usable sample was as shown in Table 1.

6. Research findings

Al-Hyani (2013) indicates that the most common constraint hindering SME growth and survival is a lack of qualified human resources. Gandhi and Mohan (2014) echo the sentiment that illiteracy is a serious problem facing South African rural entrepreneurs. In this study, the analysis was done with regard to business skills of rural SMEs to see if this remains a problem in rural SMEs, with specific reference to the KZN areas. Based on the data analysis, the majority of respondents (30 or 24 percent), across industries, strongly agreed and 52 (41 percent) agreed with the statement. There were also 19 (15 percent) of the respondents who were not sure whether they agreed with the statement, while very few of the respondents, 20 (16 percent) disagreed and six (five percent) strongly disagreed. Based on the statement, it is clear that a lack of skills has an impact on the survival and growth of rural SMEs in KZN.

6.1. The use of modern facilities.

According to Ngorora and Mago (2013), rural entrepreneurship is faced with the challenge of a lack of equipment. Un Nabi and Dornberger (2013, p. 16) maintain that technological capability is widely known as a strategic source of growth and wealth at the national and the firms’ levels. Figure 3 illustrates the analysis of the results regarding the use of modern facilities by rural SMEs. The findings show that most respondents, 26 (21 percent) and 58 (46 percent) agree with the statement that modern facilities are used in their businesses. However, 20 (16 percent) of the respondents remained neutral to the statement. The number of respondents who indicated that modern facilities are not used in their businesses were 18 (14 percent) and five (four percent), respectively, disagreeing and strongly disagreeing.

6.2. Factors hindering investment strategies.

Fakoti and Asah (2011, p. 170) state that, in South Africa, the limiting factor for SME survival and growth is perceived to be the non-availability of debt financing. Zhou and De Wit (2009) support the claim that financial capital is found to be crucial to firm growth. A large proportion of the respondents, 32 (25 percent) and 60 (47 percent) strongly agreed and agreed, respectively, with the statement that most of their business investment strategies are hindered by a lack of finance. While 23 (18 percent) of respondents are neutral, very few of the respondents, nine (seven percent) and three (two percent) disagree and strongly disagree, respectively.
A Chi-square test, using the correlation analysis of the results, was performed to determine whether lack of financial support hindered survival and growth of rural SMEs. The question was based on the null hypothesis of uniformity of expected responses to questions. The results ($X^2 = .444; \text{df} = .95721; P = .000$) indicated that the observed findings were significantly different from expected frequencies. In other words, this result was statistically significant and was not due to chance.

6.3. Size of the local market. Khan and Siddiqi (2004, pp. 1-34) indicate that market size has been found to be an important factor affecting a firm’s growth. The majority of the respondents, 22 (17 percent) and 57 (45 percent) strongly agreed and agreed, respectively, with the statement that the local market is very small to sell the products of their businesses. From this statement, it is clear that respondents find it very difficult to sell their products in the local market. More than a quarter, 27 (21 percent), of the respondents remained neutral, while less than half of the respondents, 14 (11 percent) and seven (six percent) disagreed and strongly disagreed, respectively, with the statement.

Chi-square testing, with the correlation analysis of the results, was performed to determine whether the small size of the local market has an impact on the survival and growth of rural SMEs. The question was based on the null hypothesis of uniformity of expected responses to questions. The results ($X^2 = .406; \text{df} = 1.07290; P = .000$) indicated that the observed findings were significantly different from expected frequencies. In other words, this result was statistically significant and was not due to chance.

6.4. Condition of infrastructure. It has been noticed that condition of infrastructure can also present challenges for the owner and his or her business. Standard business infrastructure, including transportation networks, telecommunications, internet and banks, plus social infrastructure such as school and healthcare, may be limited, less developed or nonexistent, as compared with urban (Labrianidis, 2006). The majority of the respondents, 28 (22 percent) and 52 (41 percent) strongly agreed and agreed with the statement that poor infrastructure impacts rural SMEs in KZN. While 25 (20 percent) of the respondents remained neutral, 18 (14 percent) and four (three percent) strongly disagreed and agreed, respectively, with the statement.

7. Limitations
Lack of time and willingness by entrepreneurs to complete questionnaires might create problems in obtaining a representative sample. This study was focused only on existing businesses and did not consider proposals for new businesses.

7.1. Implications of the research. The rural SMEs owner/managers, the findings of this study indicate that due to difficulty economic conditions in the South African rural areas with specific reference in KZN, SMEs cannot expand their local market share, as many local customers do not have money and live below economic line. SME also cannot improve in their innovation strategies due to turbulent environment such as poor technology availability in some areas where there is no network or broadband signal. Transport network system in the South Africa rural areas where in some places there are no tire roads or roads are just making by local villagers without any formal engineering skills, therefore, this has negative implications, as affects the distribution of products to the target market in time and also discourage potential new young entrepreneurs.
Recommendations for further research

Further research should assess the use of modern technology as a strategic tool for the improvement of business characteristics typifying rural SMEs, KZN in particular. This concept will help to expand market size of SMEs by reaching a large customer base. The use of technology will assist in terms of poor infrastructure challenges, such as roads and electricity supply.
